Syntoralis FIFO Logistic

Product	Syntoralis FIFO Logistic
Publisher	Syntoralis EURL
Version	1.0.0.57
Platform	Microsoft Dynamics 365 Business Central 27.0+ (Cloud)
Datasheet date	29/10/2026
License	Proprietary
Documentation	Online documentation
Marketplace	Product page on Microsoft Marketplace

Promise: Pick the oldest stock, automatically, across all your warehouse processes. Reduce stock ageing, eliminate allocation errors and stay compliant in all circumstances - without changing your Business Central processes.

General overview

Syntoralis FIFO Logistic is a **Microsoft Dynamics 365 Business Central** extension that guarantees real **physical FIFO** rotation: your picks consume the oldest available stock, based on the real date and time of stock entry (*last stock entry movement*), **regardless of the stock's position in the warehouse**.

Whereas standard Business Central FIFO is primarily an *accounting valuation* method, Syntoralis FIFO Logistic acts at the **physical execution** level: your operators always prepare the right stock, at the right time.

In short: the right stock, at the right time - for every pick.

What does physical FIFO solve?

In many Business Central warehouses, FIFO is managed by accounting... but not by physical preparation:

- The most recent stock is often picked first (proximity, ease of access).
- Older stock stays at the back of bins, ages and becomes obsolete.
- Losses and write-downs increase without visibility.
- Audits and traceability are hard to justify.
- Lot- and serial-tracked items complicate rotation.

Result: waste, hidden costs, compliance risks and margin loss.

The solution: automated physical FIFO

Syntoralis FIFO Logistic takes control of stock selection when picks are created:

- Automatically selects the oldest stock based on the **last stock entry movement**.
- Works on all stock outbound processes (warehouse picks, inventory, manual movements, replenishment).
- Handles lot-tracked, serial-tracked items and expiry dates (FEFO).
- Automatically splits lines across multiple FIFO layers when needed.
- Provides full visibility through the **Warehouse Inventory** page.
- Integrates without changing your standard Business Central processes.

Key benefits

Benefit	What you gain
Accuracy	Always the right stock picked - zero allocation errors
No waste	Oldest stock leaves first - less obsolescence
Audit-ready	Full visibility of FIFO layers, entry dates, remaining quantities
Speed	Faster picks, fewer manual searches
Fast ROI	Reduced losses and storage costs

> Lot / serial / FEFO compatibility and non-intrusiveness: see §3 and §6.

Who is it for?

- **Discrete, process and project manufacturers** with warehouse management.
- **Multi-bin warehouses** seeking strict FIFO rotation even without full traceability.
- **Companies with perishable or limited-shelf-life items.**
- **Organizations subject to audits** (traceability, FIFO, FEFO).
- **Logistics teams** seeking to reduce waste and errors.

Key features

Feature	Customer benefit
FIFO picking engine	Automatic selection of the oldest stock across all your processes
Lot-tracked items	FIFO rotation of lots based on their stock entry (see §3)
Serial-tracked items	FIFO selection of serial numbers (see §3)
FEFO compatibility	Unified FIFO/FEFO management for perishable items (see §3)
Automatic splitting	Smart distribution across multiple FIFO layers (see §3)
Warehouse Inventory page	Operational visibility of FIFO layers and consumption order (see §3)
FIFO recalculation	Initialization on existing environments, in the background (see §8)
Centralized setup	Global activation then per location, safely (see §8)
Multilingual	14 languages available (see §10)

Typical use case

Receiving: stock enters the warehouse, the entry date/time (*last stock entry movement*) is recorded.

Storage: stock is put away into bins according to your organization.

Picking: when a pick is created, the system automatically selects the oldest stock.

Preparation: the operator prepares the selected stock - zero errors, zero waste.

Audit: verify the FIFO sequence at any time (see §6, Warehouse Inventory page).

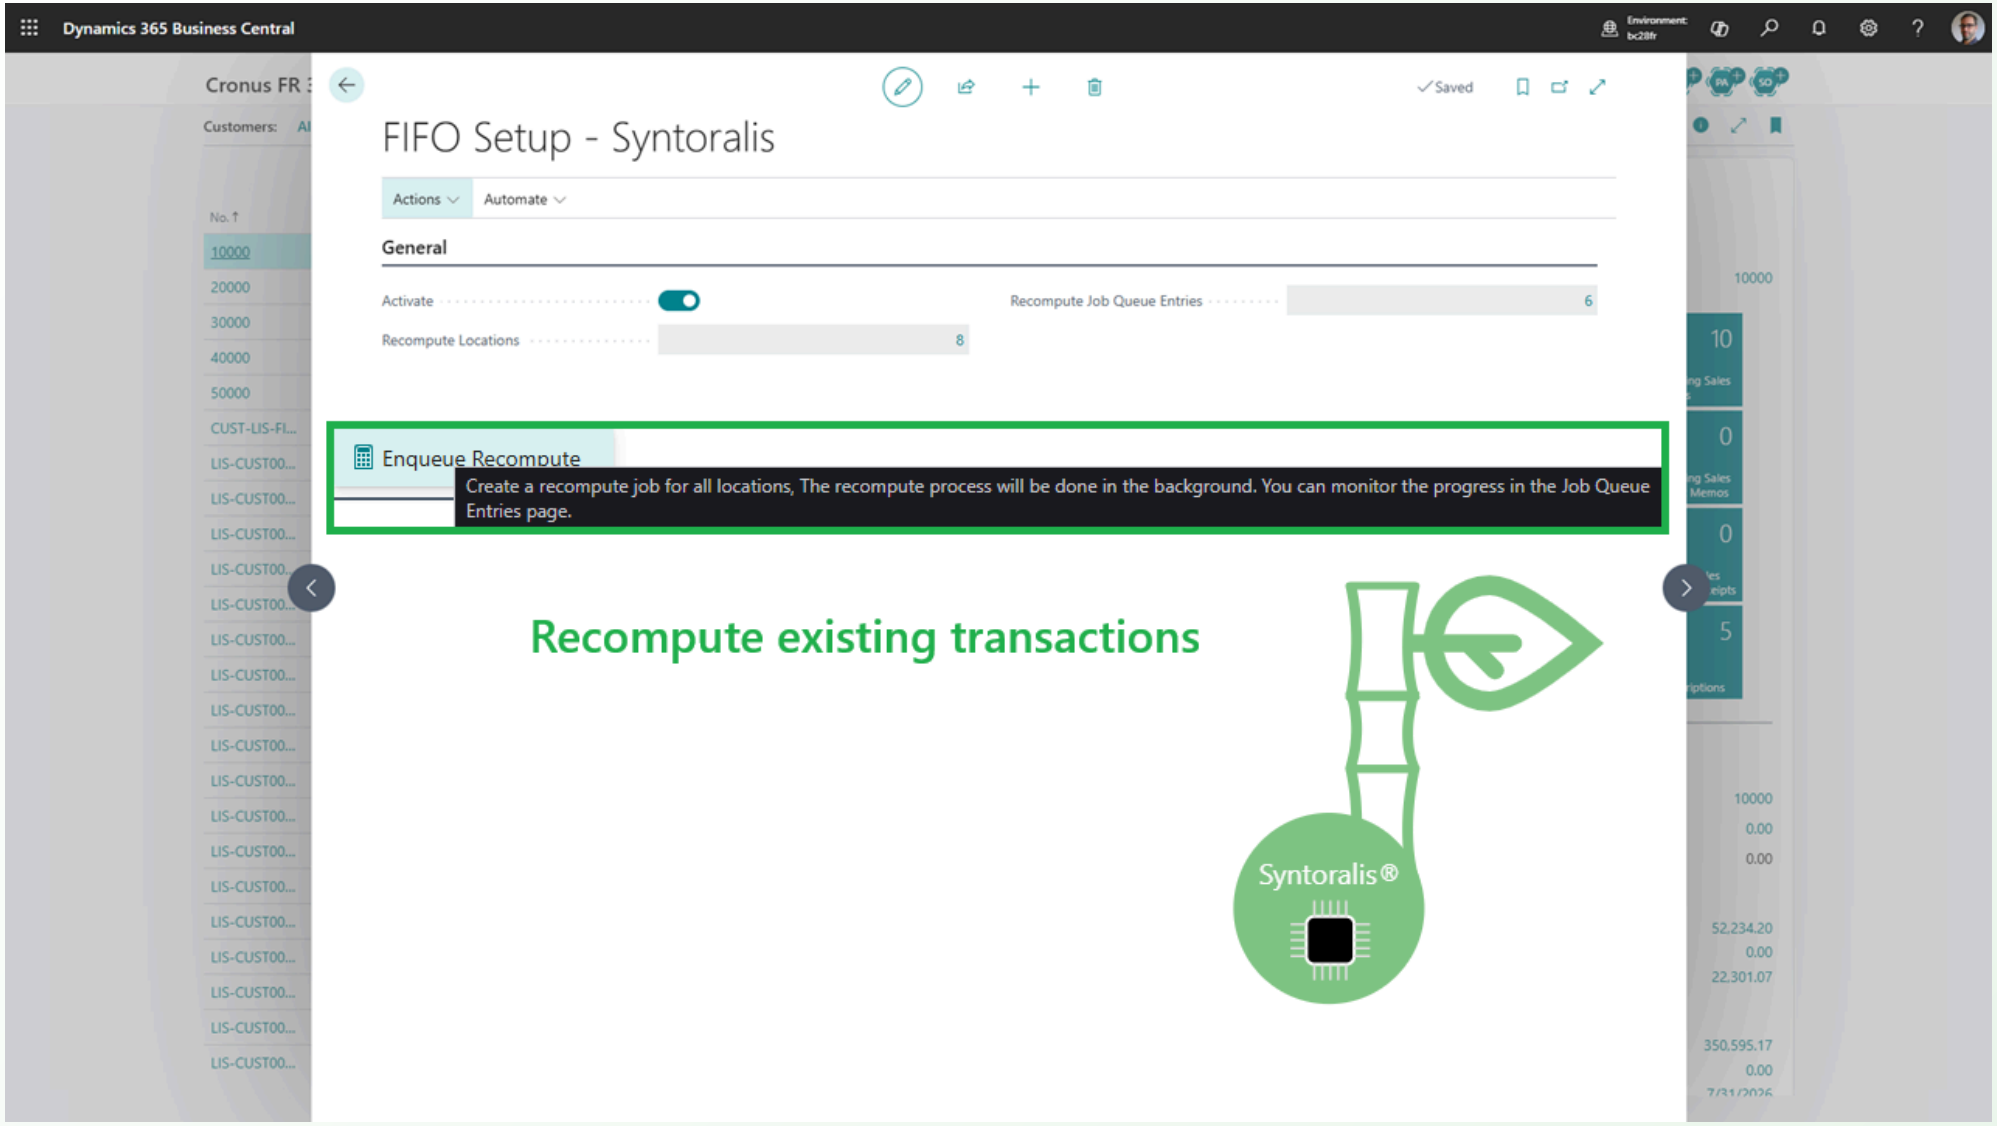

Quick deployment without disrupting your business

FIFO recalculation - initializes FIFO layers from your warehouse history.

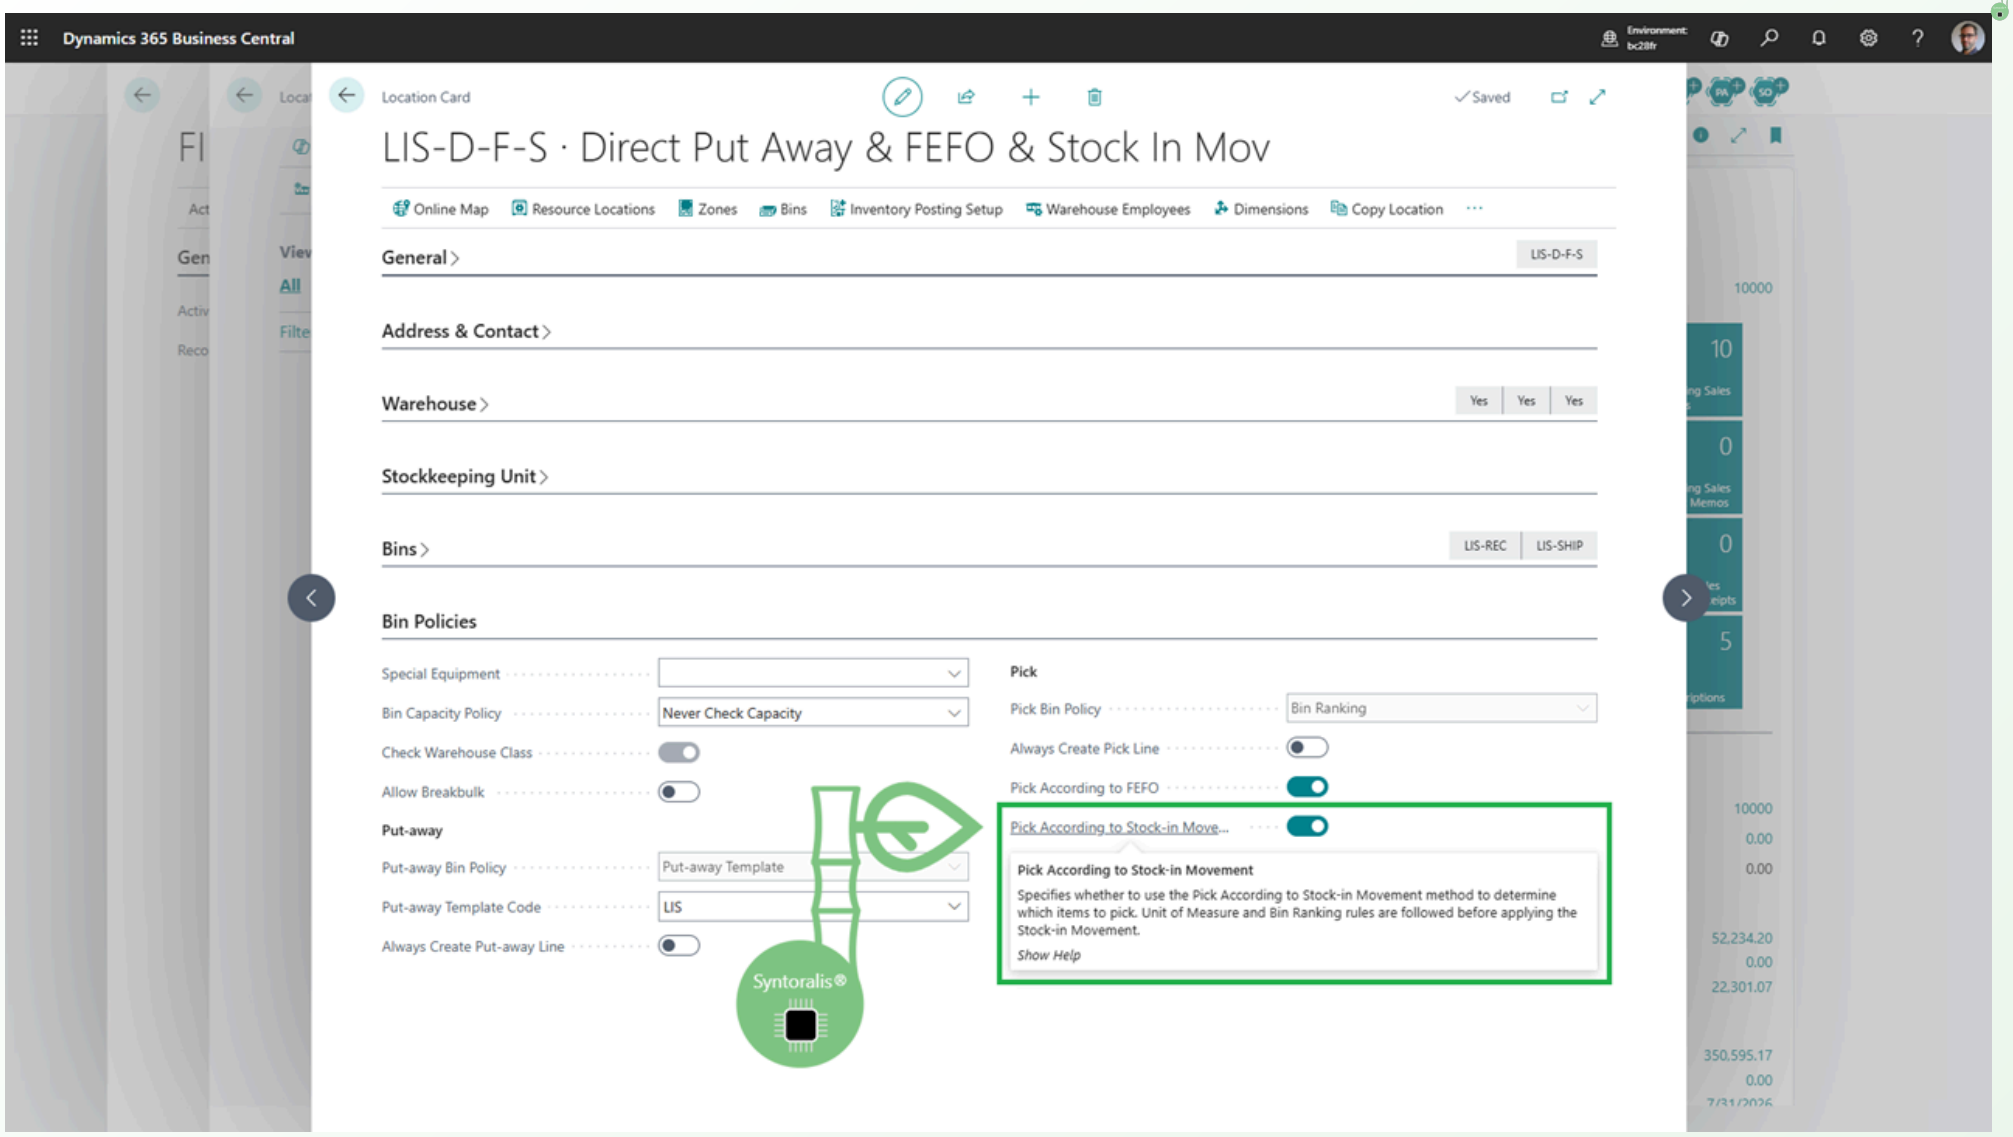

Activation - enable globally then per location.

Operation - your picks automatically consume the oldest stock.

Compatibility & prerequisites

- **Microsoft Dynamics 365 Business Central** version 27.0 or later (Cloud or On-Premises).
- Standard warehouse management enabled (bins, warehouse activities).
- FIFO bins do not use default, fixed or dedicated bins.
- Bin selection policy by: *Bin Ranking*.
- **14 languages** supported: Czech, Danish, German, English, Spanish, Finnish, French, Icelandic, Italian, Norwegian Bokmål, Dutch, Portuguese, Russian, Swedish.

Pricing & trial

Free trial available - test on your environment.

Pricing based on number of users / subscription (see Marketplace listing).

Support included via documentation and publisher.

FAQ

Q: Isn't standard Business Central FIFO enough?

A: Not for physical rotation - standard FIFO is an *accounting valuation* method; Syntoralis FIFO Logistic guarantees *physical* stock rotation, regardless of bin (see §1).

Q: Do I need to change my existing processes?

A: No. The extension integrates with standard Business Central warehouse management processes (see §3).

Q: Can FIFO be enabled on some locations only?

A: Yes. Activation is done globally then per location, in a controlled way (see §8).

Q: What happens with lot- and serial-tracked items?

A: They are handled according to FIFO rules based on the **last stock entry movement** (see §3 and §6).

Q: Is it compatible with FEFO?

A: Yes, a dedicated compatibility logic avoids FIFO/FEFO conflicts (see §3 and §6).

Q: How do I initialize on an environment already in use?

A: Via the **FIFO recalculation** function, which rebuilds FIFO layers from warehouse history (potentially long processing depending on existing data volume) (see §8).
